```
This invention describes the novel use of an antibody targeted to a human cellular membrane antigen, to manufacture a medicament to prophylactically vaccinate against cancer. The antibodies against tumor associated antigen (TAA) for prophylactic and/or therapeutic vaccination against cancer may be used in low doses (when compared to antibodies against TAA for passive immunotherapy), typically less than 1 mg by injection. The antibodies also have a long continual activity that directly induces immunity and their shelf life is unlimited (Iresh vaccination is always possible). This sequence represents the murine monoclonal antibody MAK HEZ variable region heavy chain fragment which is used in the method of the invention
                                                                                                                                        s; monoclonal antibody; MAK HE2; heavy chain; variable region; cellular membrane antigen; tumor associated antigen; TAA; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel use of antibodies against human cellular membrane antigens vaccination against cancer.
                                                                                                        Murine monoclonal antibody MAK HE2 variable region heavy chain.

The humanised ig is capable of binding to GPID/IIIa and inhibiting platelet aggregation and also the releasing reaction of platelets. The Ig can be used for treating cardiovascular diseases and thromboembolic disorders, e.g. acute myocardial infarction, unstable angina, stroke, transient ischemic episodes, deep vein thrombosis and pulmonary embolism,
                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New humanised immunoglobulin which binds GPIIb/IIIa - derived from mouse C4G1 antibody, used for inhibiting platelet aggregation for treating cardiovascular and thromboembolic disorders.

The method involves removing a saccharyl subunit from the peptide, thus forming a truncated glycan, and contacting the truncated glycan with at least one glycosyltransferase and at least one glycosyl donor under conditions suitable to transfer at least one glycosyl donor to the truncated glycan, thus remodeling the peptide. Conjugates can be formed between a granulocyte colony stimulating factor (G-CSF) peptide, interferon alpha peptide, interferon beta peptide, Factor VIIa peptide.

```

```
This is the sequence of the mouse C4G1 immunoglobulin heavy chain. See AAR32265 for the light chain sequence. The antibody is specific for the GPIIa/IIIb protein and inhibits platelet agglutination. The Ig is thus useful in the treatment of thrombosis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                ò
                                                                                                                                            This is the amino acid sequence of the mouse antibody C4G1 heavy chain, used in the method of the invention involving the creation of a humanised immunoglobulin (IG) derived from the mouse C4G1 antibody. The humanised IG is capable of binding to GPIID/IIIa and inhibiting platelet aggregation and also the releasing reaction of platelets. The IG can be used for treating cardiovascular diseases and thromboembolic disorders, e.g. acutem myocardial infarction, unstable angina, stroke, transient ischemic episodes, deep vein thrombosis and pulmonary embolism, extracorporeal cardiopulmonary circulation. The Ig can also be used in diagnosing the presence and location of a thrombus, or certain types of cancer cells which develop GPIID/IIIa on their surfaces, for the detection of GPIID/IIIa antigens or for isolating platelets. (Updated on 25-MAR-2003 to correct PA field.)
                                                                            New humanised immunoglobulin which binds GPIIb/IIIa - derived from mouse C4G1 antibody, used for inhibiting platelet aggregation for treating cardiovascular and thromboembolic disorders.

```
The present sequence represents the heavy chain variable region for monoclonal antibody (MAD) 14F11, which immunoreacts with a lead cation. The sequence was derived from RNA isolated from mouse hybridoma cells. The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cometics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials for electronic components. The products can provide for applications involving minute amounts of specific heavy metals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

New light and heavy chain variable regions of a monoclonal antibody against the S-surface antigen of the hepatitis B virus (HBV), useful for neutralizing or removing HBV, or for preventing or treating HBV
                                                                                                                                                               The invention relates to light and heavy chain variable regions of a monoclonal antibody against S-surface antigen of the hepatitis B virus (HBV). The variable regions of the antibodies are useful against HBV S-surface antigens, e.g. adr. adw, arr or ayw, particularly for neutralising or removing HBV. They may also be employed to treat or prevent HBV. Integers the present sequence is Escherichia coli heavy
                                                                                                                     Claim 12; Page 17; 20pp; English.

Komatsu Y, Yoshida M;

WPI; 2002-750555/81. N-PSDB; ABS55467. Production of anti-acetyllysine monoclonal antibody capable of recognizing Napproximatelyi-acetyllysine regardless of types of adjacent amino acids, useful in e.g. disease diagnosis and searching for novel acetyllysine-containing proteins.

Example 4; Fig 4; 45pp; Japanese

The present invention relates to a mouse anti-acetyllysine monoclonal antibody (mAb) capable of recognising N epsilon-acetyllysine, and a method for producing the monoclonal antibody. The produced antibody is useful in searching for and functional analysis of novel acetyllysine. Containing proteins particularly in studying pathosis due to acetylated proteins, disease diagnosis, facilitating detection of variation in acetylation levels of histone influenced by various stimulations during western blotting, analysis of the variable region in the DNA sequence of an antibody gene of an antibody-producing immortalised cell, and judging the degree of homology specific to the sequence during the protein translation. The monoclonal antibody of the invention is capable of recognising N epsilon-acetyllysine regardless of the type of adjacent amino acids and accepting adjacent amino acids over a broad range. The present sequence represents a heavy chain of mouse anti-acetyllysine mAb

Ghoshdasti P, Robinson R; Horwitz AH, Better MD,

WPI; 1991-178105/24. N-PSDB; AAQ12062. New chimeric mouse-human antibodies - used to detect, kill and remove HIV-1 antigen from sample.

Disclosure, Fig 17; 107pp; English.

This is the heavy - chain variable (V) region of a mouse monoclonal antibody (MAb), 4D12, and is specific for an HIV-1 viral antigen. It is used in the construction of a chimeric MAb comprising heavy and light chains having murine V regions and human C regions. The chimeric MAbs are more effective than murine MAb 4D12 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined

These novel sequence are useful in tractment, diagnosis and prophylaxis of HIV infections, and may be produced by a bacterial, yeast or mammalian expression system. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct
by manipulating their respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MAbs can be used as immunoconjugates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV. See also AAQ12056-61 and AAQ12063. ```
The sequence is used in the prodn. of a chimeric antibody mol, comprising two light chains and two heavy chains, each having a constant region (muth) and a variable region (mutine) having specificity to an antigen bound by mutine monoclonal antibody (MAb) B38.1. The chimeric antibodies can be used for any purpose for which the original mutine MAbs can be body. They are esp. that they are more compatible with the human body. They are more compatible with the human body. They are sep. used for the diagnosis and treatment of cancer. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ñ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      116

The heavy chain variable region (AAW06216) of mouse monoclonal antibody ME4 is the product of a CDNA clone (AAT4341) isolated from a ME4 hybridoma cDNA library. MAD ME4 (1931) binds to an antigon that is expressed on the surface of human lung, breast, colon and ovary carcinomas and melanomas, but not on most normal adult tissues. The heavy chain and light chain variable regions (see also AAW06219) of ME4 can be linked to human constant regions and expressed in transformed host cells. Novel mouse-human chimeric antibodies (see also AAW06209-14 and AAW06217-18) can the treatment and diagnosis of human cancer. (Updated on 25-MAR-2003 to correct PF field.)

The present sequence represents the heavy chain variable region of murine amtibody ME4. The sequence was used to create chimeric mouse-human immunoglobulins which recognise the human tumour antigen bound by antibody ING-1 (produced by hybridoma cell line ATCC HB 9812). The chimeric antibodies also have an antigen-binding site that competitively inhibits the binding of antibody ING-1, and mediate complement-dependent cytolysis of target cells or antibody-dependent cellular cytotoxifity to purposes in the treatment of human cancer. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 NEKFKGKATITADKSSSTAYMQLSSLTSDDSAVYFCARD--GPWFA--YWGQGTLVTVSA 116

Mouse antibody heavy chain variable region #4.

(first entry)

16-APR-2003

```
Antibody for detecting antigen in animal or killing cells carrying antigen comprises human constant region and variable region having specificity for human tumor antigen bound by ING-1 antibody.
                                                                                                                                                Example 3; Fig 30; 101pp; English.

```

The invention describes an antibody comprising a human constant region and a variable region having specificity for the human tumour antigen bound by the ING-1 antibody, where the ING-1 is produced by cell line HB9812 as deposited with ATCC, and the antibody has the same affinity as the ING-1 for the human tumour antigen. The antibody is useful in an immunasasy method for detecting an antigen in a sample by contacting a label and relating the detected label to the presence of the antigen; for use in an inaging method for revealing the presence of the antigen; for use in an inaging method for revealing the presence of a label-detectable antigen in an animal by contacting the antibody with a part of the animal subspected of containing the antigen, detecting the label and relating the carrying an antigen by contacting the calls with the antibody and allowing the killing to cocur. The antibodies are useful in tumour dispension and therapy. The chimeric antibodies bind to the surface of human tumour cells but do not bind detectably to normal cells, e.g., fibroblasts, endothelial cells or epithelial cells in the major organs. The high biological activity of the chimeric antibodies against human tumour cell lines combined with minimal reactivity with normal tissues imply that these antibodies may mediate selective destruction of antigent contains antibodies may mediate selective destruction of antigent contains an antigent contains an antigent contains and antigent contains an antigent contains an antigent contains and antigent contains an antigent contains an antigent contains and antigent contains an antigent contains an antigent contains and antigent contains an antigent contains an antigent contains and antigent contains an antigent contains an antigent contains and antigent contains an antigent contains an antigent contains and antigent contains an antigent contains an antigent contains and antigent contains and antigent contains an antigent contains and antigent contains and antigent contains and antigent contai maintaint closure into presence of mannary action that man articular determinants on the chimeric antibodies increases their resistance to rapid clearance from the body relative to the original murine mAbs. This resistance to clearance enhances the potential utility of these chimeric antibodies, as well as their derivatives, in tumour diagnosis and therapy. This is the amino acid sequence of a mouse antibody heavy chain variable region used in the creation of an anti-human tumour antigen-

This sequence represents the variable heavy chain of the antibody produced by hybridoma 5-465-210, and can be detected using the method of the produced by hybridoma 5-465-210, and can be detected using the method of the presence of antibody which may be present in a test sample. It comprises contacting a test sample suspected of containing the antibody with an antigen specific for the cuspected of containing the antibody with an antigen specific for the engloying as a control or calibrator, a reagent which binds to the employing, as the control or calibrator, a reagent which binds to the antibody constant region epitopes, where the reagent binds to the antigen and is homogeneous with respect to specificity and affinity. The method can be also be used for detecting the presence of antibodies developed against more than one antigen. The method is used particularly for the detection of human antibodies specific for a given antigen, e.g. HIV-1. Hepatitis E virus, rubella virus, etc. Use of the reagents circumvent all of the problems associated with using an immune sera in the manufacture of clanbractors and positive controls. The present reagents can be readily and reproducibly generated in virtually unlimited quantities and are also useful for quantitating, and monitoring the integrity of, the antigen

F	Destroying cancer cells with agent that binds to prostate specific
PŢ	membrane antigen - on vascular endothelial cells near the cancer, or on
ΡŢ	ypertrophic or cancerous prostatic cells, also us
L.	diagnosis.

Example 12; Page 60; 94pp; English.

The present sequence represents the mouse U591 monoclonal antibody light chain variable region from an example of the present invention. The present invention describes the elimination of cancer cells by treating vascular endothelial cells (UEC) close to the cancer with an agent (A) able to bind to the extracellular domain (ECD) of prostate specific membrane antigen (PSMA). (A) both binds to the VEC and destroys the cancer cells. Also described are: (1) the detection of cancer tissue by detecting binding of labelled (A) to VEC (Dese to, or within, a cancer cancer cancer cancer cells eliminating or detecting normal, benignly hyperplastic or cancercous prostate epithelial cells using optionally labelled (A); (3)

8 g ઠે 엄

```
The method is used to treat renal, urothelial, colon, lung, rectal or breast cancers and metastatic adenocarcinoma of the liver. The diagnostic method is particularly used to detect recurrence of prostatic disease or to monitor the effect of treatments for prostate cancer (presence of PSMA in the serum indicates that prostate cells are being lysed). (A) binds to an epitope of PSMA expressed on live cells (contrast antibody 7E11 which only binds after cell lysis), allowing targeting of live, unfixed cells and thus providing more efficient treatment and diagnosis. Both cancer cells themselves and the VEC on which they depend are killed. All VEC close to cancer cells express PSMA, whatever the type of cancer, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence is a fragment of the light chain of the monoclonal antibody 291. The invention relates to an isolated antibody or its antison binding portion (I) which binds to an extracellular domain of prostate specific membrane antigen and which does not require cell lysis to bind to the extracellular domain. The antibody or its antigen binding portion is selected for its ability to bind to live cells. (I) is useful for diagnosis of diseases associated with the presence of normal, benign
                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ű

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method of killing cancer cells, particularly prostate cancer cells, by directing a biological agent to the cells which then binds to a prostate specific membrane antigen and causes the molecule to be internalised. The internalisation of the agent, which may be bound to a drug or which may act to kill the cell alone, then leads to the death of the cell. The present sequence forms part of
hyperplastic, and cancerous epithelial cells or portions. Also it can be used for identifying the recurrence of such diseases, particularly when the disease is localised in a particular biological material of the patient for e.g. recurrence of prostatic disease. They can also be used alone or bound to a substance effective to kill cancerous prostate epithelial cells as a therapy for prostate cancer. Binding and internalising of the antibody with the prostate specific membrane antigen, permits the therapeutic use of intracellularly acting cytotoxic agents. (I) targets only prostate epithelial cells and other tissue are spared which provides safer treatment particularly for elderly patients. The antibodies bind to living prostate cells and treatments using these antibodies are more effective than those which target lysed prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes the novel use of an antibody targeted to a human callular membrane antigen, to manufacture a medicament to prophylactically and/or therapeutically vaccinate against cancer. The antibodies against tumor associated antigen (TRA) for prophylactic and/or therapeutic vaccination against cancer may be used in low doses (when compared to antibodies against TRA for passive immunotherapy), typically less than 1 mg by injection. The antibodies also have a long continual activity that directly induces immunity and their shelf life is unlimited (fresh vaccination is always possible). This sequence represents the which is used in the method of the invention
                                                                                                                               9
                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                      Murine, monoclonal antibody, MAK HE2, light chain, variable region,
human cellular membrane antigen, tumor associated antigen, TAA, vaccine,
an antibody which may be used as the biological agent of the invention. In addition to prostate cancer, the method can be used with renal, urothelial, colon, renal, lung and breast cancer cells, and cancerous cells of metastatic adenocarcinoma to the liver
                                                                                                                                                  1 NIVMTQSPKSMSMSVGERVTLTCKASENVVTYVSWYQQKPEQSPKLLIYGASNRYTGVPD

Light and heavy chain variable region sequences were deduced from the DNA sequences obtd. by PCR of DNA sequences obtd. from the hybridoma cell line lE6-2012 (ATCC HB 10693). The light and heavy chain regions may be used to construct a monoclonal antibody active against LPA-3 which blocks adhesion of LFA-3 expressing cells to lymphocytes. The antibody may be used in the treatment and diagnosis of acute and chronic inflammation, autoimmune diseases and for immuno- modulation including systemic lupus erythematosus, rheumatoid arthritis and thyroiditis. See also AAR27145s. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents the mouse J591 monoclonal antibody light chain from an example of the present invention. The present invention describes the elimination of cancer cells by treating vascular endothelial cells (VEC) close to the cancer with an agent (A) able to bind to the extracellular domain (ECD) of prostate specific membrane antigen (PSMA). (A) both binds to the VEC and destroys the cancer cells. Also described are: (1) the derection of cancer tissue by detecting binding of labelled (A) to VEC close to, or within, a cancer tissue; (2) climinating or detecting normal, benighly hyperplastic or cancerous prostate epithelial cells using optionally labelled (A); (3) hybridoms that produce a monoclonal antibody (MAD) that binds to PSMA. The method is used to treat renal, urothelial, colon, lung, rectal or breast cancers and metastatic adenocarcinoma of the liver. The diagnostic method is particularly used to detect recurrence of prostatic disease or to monitor the effect of treatments for prostate cancer (presence of PSMA in the epitope of PSMA expressed on live cells (contrast antibody 7E11 which only binds after cell lysis), allowing targeting of live, unfixed cells and thus providing more efficient treatment and diagnosis. Both cancer cells themselves and the VEC on which they depend are killed. All VEC on the VEC on which they depend are killed. All VEC on the VEC on which they depend are killed. All VEC on the VEC on the VEC on the type of cancer, but
Destroying cancer cells with agent that binds to prostate specific membrane antigen - on vascular endothelial cells near the cancer, or on normal, hypertrophic or cancerous prostatic cells, also used for
                                                                                                                                                                                                                                                                                                                                                                                             Mouse, monoclonal antibody, J591; prostate specific membrane antigen, cancer; vascular endothelial cell; metastatic adenocarcinoma.

This sequence is the kappa light chain of the monoclonal antibody J591. The invention relates to an isolated antibody or its antigan binding portion (I) which bind does not require cell lysis to bind to the extracellular domain. The antibody or its antigen binding portion is extracellular domain. The antibody or its antigen binding portion is selected for its ability to bind to live cells (I) is useful for diagnosis of diseases associated with the presence of normal, benign hyperplastic, and cancerous epithelial cells or portrions. Also it can be used for identifying the recurrence of such diseases, particularly when the disease is localised in a particular biological material of the patient for eg. recurrence of prostatic disease. They can also be used patient for e.g. recurrence of prostate concer. They can also be used epithelial cells as a therapy for prostate cancer. Sinding and internalishing of the antibody with the prostate specific membrane antigen, permits the therapeutic use of intracellularly acting cyclocxic antigen, permits the therapeutic use of intracellularly acting cyclocxic antigen, permits the therapeutic use of intracellularly acting cyclocxic antigen, permits character epithelial cells and other tissue are spared which provides after readment particularly for elderly patients. The antibodies bind to living prostate cells and treatments using these artiphodies are more effective than those which target lysed prostate

Monoclonal antibodies which inhibit type II phospholipase A2 are useful in the treatment of myocardial infarction, crebral infarction, acute kidney failure, chronic rheumatism, cardiac shock, pancreatitis, adult respiratory distress syndrome and collits. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2. Spleen cells from the mice were fused with mouse myeloma P3U1 (P3xSAPAB, U1) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity. Active clones were isolated including 12H5, 1.4 and 10.1. These were cultured and the antibody isolated from the culture eupernatant by precipitation with ammonium sulphate and purification on a column of protein A-Sepharose CLAB. Because the antibody acts on the primate and mouse forms of enzyme as well as human it is particularly
                                                                                                                                                                                                           Monoclonal antibody; phospholipase; myocardial infarction; pancreatitis; cerebral infarction; eaute Kidney failure; colitis; chronic rheumatism; adult respiratory distress syndrome; cardiac shock; treatment; preclinical testing; disease; hybridoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Monoclonal antibody inhibiting type II phospholipase A2 activity - for treatment of myocardial and cerebral infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21 NIVMTQSPKSMSMSVGERVTLTCKASENVVTYVSWYQQKFEQSPKLLIYGASNRYTGVPD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method of killing cancer cells, particularly prostate cancer cells, by directing a biological agent to the cells which then binds to a prostate specific membrane antigen and causes the molecule to be internalised. The internalisation of the agent, which may be bound to a drug or which may act to kill the cell alone, then leads to the death of the cell. The present sequence forms part of an antibody which may be used as the biological agent of the invention. In addition to prostate cancer, the method can be used with renal, urchhalial, colon, renal, ung and breast cancer cells, and cancerous cells of metastatic adenocarcinoma to the liver

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a chimaeric molecule comprising the GD3

(ganglioside antigen) binding domain of antibody MB3.6, with any of 3

variable gene sequences, or the PSMA (prostate-specific membrane antigen)

binding domain of antibody 3D8, 4D4 and 3B11, with variable gene

equences, the zeta signalling chain of the T cell receptor and an

intervening CD8alpha hinge in which cysteine residues have been mutated.

The chimaeric molecules expressed in T cells or NK cells or other

effector cells are useful in treating patients with cancers expressing

the GD3 (MB3.6 derivatives) or PSMA antigen (3D8, 4D4, 3B11 derivatives),

and/or together with each other or with heterologous constructs to engage
additional stimulatory and functional properties of the effector cells to

enhance the antitumour therapeutic efficacy (claimed). They are

changed the sequence of the construct of th
                                                                                                                                                                                                                                                                                                T-cell receptor; cytostatic; dermatological; neuroprotective; immunostimulant; GD3; ganglioside antigen; MB3 6; PSW4; tumour; 3D8; 4D4; 3E11; prostate-specific membrane antigen; zeta signalling chain; CD81pha hinge; cancer; melanoma; neuroendocrine tumour; prostate cancer; small cell lung cancer; light chain variable region; mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New chimeric molecule useful in treating patients with disorders, such as melanoma, neuroendocrine disorders, prostate and small cell lung cancer comprises GD3 and/or PSMA binding domains of antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 NIVMTQSPKSMSMSVGERVTLTCKASENVVTYVSWYQQKPEQSPKLLIYGASNRYTGVPD 60

The invention relates to treating a human patient diagnosed with a B-cell malignancy. The method involves (a) administering to the human patient a blocking anti-CD22 monoclonal antibody binding to the first two 1g-like domains, or to an epitope within the first two Ig-like domains of native human CD22 (hCD22) (ABR82771) and (b) monitoring the response of the malignancy to the treatment. The method is useful for treating a human patient diagnosed with a B-cell malignancy comprising Hodgkin's lymphoma, Burkitt's lymphoma, multiple myeloma, chronic lymphocytic leukemia, hairy cell leukemia or prolymphocytic leukemia. The present sequence represents the amino acid sequence for kappa light chain V-J junction for anti-CD22 antibody from hybridoma HB22-196

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to treating a human patient diagnosed with an autoimmune disease. The method involves administering to the patient an amount of a blocking anti-CD22 monoclonal antibody and monitoring the response of the autoimmune disease to the treatment. The method is useful in treating autoimmune diseases (e.g. glomerulonephritis, systemic lupus erythematosus, rheumatoid arthritis, psoriasis, ulcerative colitis, Hashimoto's thyroiditis, autoimmune haemolytic anemias, diabetes or allergiess) or B-cell malignancies (e.g. tymphomas or leukemias). The present sequence represents the amino acid sequence for kappa light chain V-J junction for anti-CD22 antibody from hybridoma HB22-196
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating an autoimmune disease or a B-cell malignancy in a human patient comprises administering an amount of an anti-CD22 monoclonal antibody to the patient and monitoring the response of the disease to the treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 NIVMTQSPKSMSMSVGERVTLTCKASENVVTYVSWYQQKPEQSPKLLIYGASNRYTGVPD 60

The invention provides a neuromodulatory agent (I) capable of promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system (CNS). (I) is capable of inducing remyelination, promoting cellular proliferation of glial cells, and promoting Ca2+ signaling with oligodendrocytes. An humanised antibody to (I) can be selected from antibody sHighZ2 (LW 22), ebwHigh Ms11910, ebv High CB2BG9, AKCR4, CB21E12, CB2HE7 or MS119ES. (I) is useful for stimulating remyelination of CNS axons, or treating demyelinating disease of CNS in a mammal in need of such therapy. (I) is capable of binding to structures and cells in CNS axons, or treating demyelinating disease of CNS of a mouse infected with Strain DA of Theiler's murine encephalomyelitis (TNEV) or for treating a human being having multiple sclerosis, or a post-neural disease of CNS. (I) is also useful for an in vitro method of stimulating the proliferation of glial cells from mixed cell culture. (I) is also useful for an in vitro method of stimulating the proliferation of glial cells from mixed cell culture. (I) is also useful for an in vitro method of stimulating the grain infection by a bacterium, virus or like pathogen that causes demyelination or other neurodegenerative condition in a subject. Methods where (I) is administered to a patient are useful for treating multiple sclerosis, Parkinson's disease, Alzheimer's disease, and other conditions in the CNS where nerves are damaged as by trainma The present contractors are served as a patient and the causes and contex conditions and the context of the angert of the conditions and any of diseases, and other conditions and sease, and do ther conditions and seases. The disease, and conditions and the context conditions and the conditions are sease. The disease, and other conditions and the conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 NIVMTQSPKSMSMSVGERVTLTCKASENVVTYVSWYQQKPEQSPKLLIYGASNRYTGVPD 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The ligands are useful for diagnosis or therapy of CD30 expressing cancers, esp. Hodgkinson's disease. Cytoplasmic RNA was isolated from calls of the mouse myeloma hybrid line Ber-H2. CDNA was isolated using reverse transcriptase. A VHDJ fragment contg. band was cut from a gel and purified. DNA corresponding to VK and Vgamma was isolated and cloned into vectors. Oligonucleotides used are given in AAT58331 to AAT58340
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Humanised antibody; HuZAF; mouse AF2 antibody; human EU antibody; AF2-VL; light chain variable region; VL; heavy chain variable region; VH; IgG2b; gamma-interferon; IFN; complementarity determining region; CDR; RR; framework region; immunosuppressive; antiinflammatory; antisclerotic; gastrointestinal; antidiabetic; antiarthritic; dermalogical; inhibitor; mutoimnume disease; graft versus host disease; organ transplant; multiple sclerosis; Type I diabetes; rheumatoid arthritis; psoriasis; systemic lupus erythematosus; SLE; Crohn's disease.

The present amino acid sequence is the mouse AF2 antibody, light chain variable region (AF2-VL). It has IgG2b isotype and kappa light chain. It is used for the construction of humanised version of mouse AF2 antibody HuZAF, that comprises mouse antibody AF2 complementarity determining regions (CDRs), functionally joined to the human acceptor antibody EU framework region (FR). HuZAF antibody specifically binds to and neutralises gamma-interferon (IFN). They can also block the binding of mouse AF2 immunoglobulin to gamma-IFN. HuZAF does not contain sequences that are immunogenically active in humans and remains unaffected by immune responses, that may reduce its activity or circulating half-life. HuZAF may be administered to treat autoimmune diseases such as graft versus host disease following organ transplant. Type I diabetes, multiple sclengs, rheumatoid arthritis, psoriasis, systemic lupus erythematosus (SLE), Habimatov bowel disease like, Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

anti-DNA autoantibody BV17-45, kappa chain V region - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Species: Mus musculus (house mouse)
C; Species: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 21-Jan-2000
C; Accession: FD0204
R; Smith, R.G.; Voss Jr., E.W.
Mol. Immunol. 27, 463-470, 1998
A; Tile: Variable region primary structures of monoclonal anti-DNA autoantibodies from P A; Reference number: PL0204
A; Rolecule type: MRNA
A; Residues: 1-108 <SMI>
A; Cross-references: OB: S55644, NID: 950198; PIDN: CAA37695.1; PID: 9930144
A; Molecule type: mRNA
A; Residues: 1-108 <SMI>
A; Cross-references: OB: S55644, NID: 950198; PIDN: CAA37695.1; PID: 9930144
C; Superfamily: immunoglobulin V region; immunoglobulin homology
F; 6-90/Domain: immunoglobulin homology cIMM>F; 24.34/Region: complementarity-determining 2
F; 50-56/Region: complementarity-determining 3
F; 96-108/Region: UH region

A,Accession: A90298
A,Molecule type: protein
A,Molecule type: protein
A,Molecule type: protein
A,Rosidues: 30-149 c&MI>
A,Note: the amidation states of residues 58, 69, 101, 111, 120, 122, and 123 were not
C,Comment: The mature chain has 12 additional residues at its amino end, due to a tan-
C,Complex: An immunoglobulin heterotetramer subunit consists of two identical light ()
Ain sulfide bonds: In some cases, such as 154 and 19M, the subunits associate into
C,Superfamily: immunoglobulin V region; immunoglobulin homology
C,Reywords: duplication; heterotetramer; immunoglobulin homology
F)1-29/Domain: aignal sequence #status predicted <1G>
F)20-149/Product: Ig kappa chain V region (MPC11) #status experimental <MAT>
F)21-131/Domain: immunoglobulin homology <1MM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ig kappa chain precursor V region (WRL-RF28L) - mouse (fragment)
